

social problems of children's medical treatment. Through literature review, the author found that children's physical and mental health development is challenged by fear of oral therapy. Therefore, children with fear of oral therapy are in a relatively weak position, and they need support from physiological, psychological and social levels. This study takes children with fear of oral therapy as the research object, aiming to explore the medical support service mode from the perspective of medical social work, give full play to the role of social workers in integrating system resources, and assist children to alleviate or overcome fear. The full text uses qualitative research methods, interviews and participatory observation methods to explore the two major environmental systems (medical institutions and family systems) closely related to children, and uses generic analysis methods to collate data. Based on the ecosystem theory and the social support theory, the research in this paper is divided into three parts: The first part is the research on the status quo of medical support for children's fear of oral treatment by medical social workers; The second part is the research on the construction of medical support service model for children's fear of oral treatment. The third part is the evaluation and research of the composite oral treatment support service model for children. Finally, the conclusions of this paper are as follows: First, the intervention of children's fear of oral therapy not only needs to pay attention to the needs of children themselves, but also needs to consider the impact of the ecological environment system in which children live; Second, medical social workers can act as the dominant and implementer of the service mode, use professional knowledge, theories and methods to embody the advantages of its integration function, actively establish cooperation with medical institutions, and take medical institutions as the position to form a composite team of social workers, medical personnel and psychological consultants to provide altruistic and supportive services. Third, the service mode proposed in this paper has its functions as follows: it can provide systematic medical support for children with oral diseases, children's families and medical institutions with the participation of medical social workers, and test the effectiveness of the service mode through scientific evaluation methods, so that it can have certain promotion value. In a word, the service mode proposed by the author opens up new ideas and methods for solving children's fear of oral treatment, and is also a relatively new exploration of social work in the medical field, providing some references and directions for dealing with the problem of children's fear of oral treatment.

摘要 在我国,与性别歧视有关的言论一直不断,尽管在国家政策影响和倡导下显性歧视已经变得非常少,隐性歧视却依旧存在,与此同时,婚前、婚外、同性性行为的问题备受政府、社会以及网络媒体等各界的关注,然而国内在性别歧视与婚前、婚外、同性性行为包容度的研究领域同时聚焦城乡差异的实证研究还比较有限。本研究采用 spss24.0 软件,对 2015 年中国综合社会调查(CGSS)的 10968 名城市和农村参与者的相关数据进行了描述性分析和回归分析,其中城镇人口样本 4774 个,农村人口样本 6194 个。分析结果表明:在个体因素变量中,在城镇和农村中,男性都表现出对婚前性行为和婚外性行为包容度更高;年龄越小对婚前性行为和同性性行为包容度都越高;少数民族都比汉族更能包容同性性行为;受教育程度越高越能包容同性性行为;而在农村地区,汉族人民比少数民族对婚前性行为和同性性行为包容度低,而在城市地区没有表现出显著影响;城市地区,身体健康状况对婚前性行为和同性性行为的包容度产生显著正向影响,婚姻状况对同性性行为的包容度产生显著负向影响,在农村地区这两者都没有表现出显著影响。在控制个体因素的情况下,城乡地区性别歧视对婚前、婚外、同性性行为三者包容度表现出异同:相同的地方在于城乡地区性别歧视均对婚前性行为的包容度和婚外性行为的包容度产生显著正向影响,不同的地方在于性别歧视在农村地区对同性性行为的包容度有显著正向影响,在城镇中则没有显著影响。由此可见,城乡地区经济发展水平、传统文化、社会规范和生活环境的不同,会影响到人们的价值观念和态度,政府、媒体和社会要采取正确的和多样

的方式引导公众性态度的合理化定型，并减轻社会上的性别歧视现象，降低性别歧视带来的负面影响。

Abstract : In China, there have been constant speeches related to gender discrimination. Although explicit discrimination has become very rare under the influence and advocacy of national policies, implicit discrimination still exists. The problems of premarital, extramarital, and same-sex sexual behavior have received attention from the government, society, and online media. However, domestic research on gender discrimination and premarital, extramarital, and same-sex sexual tolerance while focusing on urban-rural differences is still relatively limited. This study uses spss24.0 to perform descriptive analysis and regression analysis on the relevant data of 10968 urban and rural participants in the 2015 China Comprehensive Social Survey (CGSS), including 4,774 urban population samples and 6,194 rural population samples . The analysis results show that in individual factor variables, both in urban and rural areas, men show greater tolerance for premarital sex and extramarital sex; the younger the age, the higher the tolerance for premarital sex and same-sex sex. Minorities are more tolerant of same-sex sexual behavior than Han people; the higher the level of education, the more tolerant of same-sex sexual behavior; while in rural areas, Han people are less tolerant of premarital sex and same-sex behavior than ethnic minorities, while in urban Regions did not show a significant impact; in urban areas, physical health status has a significant positive impact on the tolerance of premarital sex and same-sex sexual behavior, and marital status has a significant negative impact on the tolerance of same-sex sexual behavior. In rural areas, both None of them showed a significant impact. Under the control of individual factors, gender discrimination in urban and rural areas shows similarities and differences in the tolerance of premarital, extramarital, and same-sex sexual behavior; the same thing is that both urban and rural gender discrimination in tolerance of premarital sex and extramarital sexual behavior The difference is that gender discrimination has a significant positive impact on the tolerance of same-sex sexual behavior in rural areas, but has no significant impact in urban areas. This shows that differences in the level of economic development, traditional culture, social norms, and living environment in urban and rural areas will affect people's values and attitudes. The government, the media, and society should adopt correct and diverse ways to guide the rationalization and finalization of public sexual attitudes, and reduce gender discrimination and the negative impact of gender discrimination.

依恋对大学生网络欺凌旁观者干预的影响：网络人际信任的中介作用

支愧云¹（通讯作者）张舒瑞¹ 刘枚枚¹ 宗雪琴¹ 张梓涵¹ 曹莹¹ 张尚贤¹

¹ 重庆大学公共管理学院，重庆，400044, kyzhi@cqu.edu.cn

摘 要 大学生作为社交网站使用的主力军，会不可避免地成为网络欺凌事件中的旁观者，其行为影响着事件的发展演变。网络欺凌旁观者干预指旁观者在目睹网络欺凌事件时，通过直接或间接方式做出的制止欺凌者或保护受害者的行为。已有研究证实，网络欺凌旁观者干预能够在欺凌事件中为受害者提供即时帮助，并预防未来网络欺凌事件的发生。依恋作为一种较为稳定的特质会对个体的人际信任产生重要影响，而人际信任与网络中的助人行为等存在密切关系，因此我们假设大学生依恋既可能会直接预测网络欺凌旁观者干预，
